

# Bisyllabicity and Prosodic Domains

Jochen Trommer

`jtrommer@uni-leipzig.de`

University of Leipzig  
Department of Linguistics

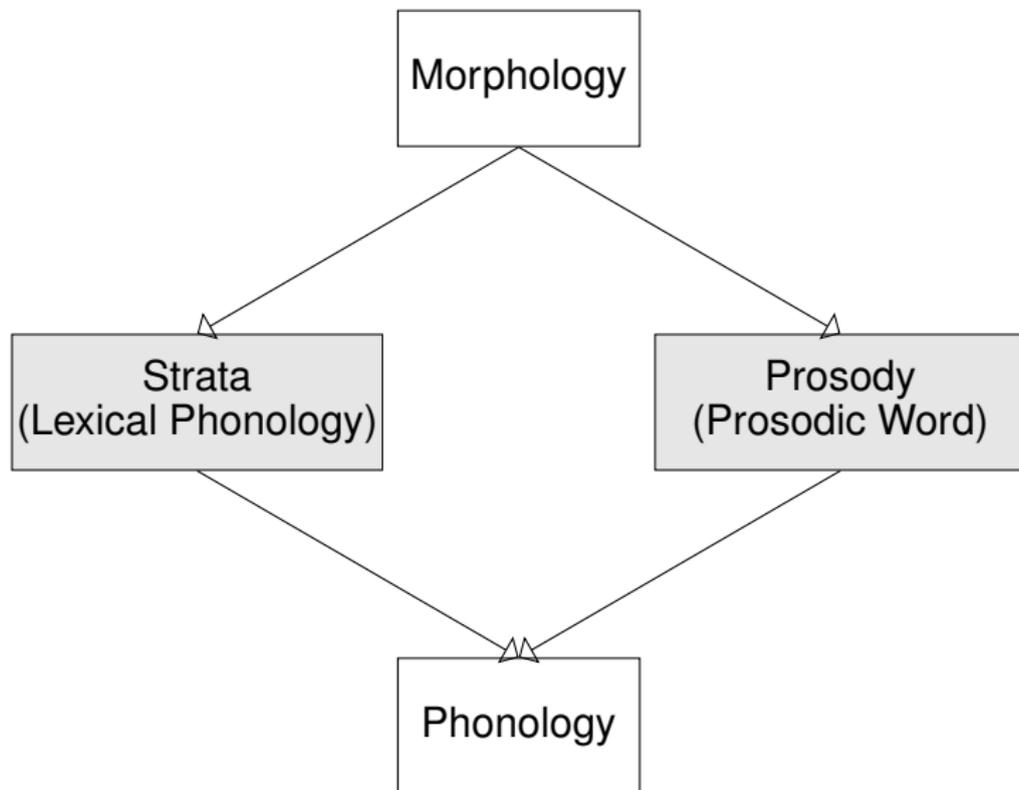

Prosodic Alignment at the Word Level  
November 20 & 21, 2008

# What is a Prosodic Word?

A set of morphological boundary symbols  
the grammar makes visible to phonology

(Scheer, 2008; Neeleman and van de Koot, 2006)

# The Dual-Route Model of Nespov & Vogel (1986)

## Goal of this Talk

Explore whether PWords can be replaced by Strata

# Empirical Domain

Phonological processes where

bisyllabic affixes seem to behave as PWords,

while monosyllabic affixes don't

# Roadmap

Strata

Ngalakan Word Stress

Yidj Penultimate Vowel Lengthening

Hungarian Vowel Harmony

## Traditional Stratal OT (Kiparsky, 2000)

- ▶ (At the root level,  
only roots undergo phonological evaluation)
  - ▶ At the stem level,  
only stems undergo phonological evaluation
  - ▶ At the word level,  
only words undergo phonological evaluation
- Affixes never undergo phonological evaluation on their own

## Egalitarian Stratal OT (Bermudez-Otero, 2008)

A derivation of a word is based on a lexical array  
(the set of all roots and affixes to be part of the word)  
which are successively combined

At every level all maximal morphological objects  
undergo phonological evaluation

(i.e. all morphological objects  
which are not part of other morphological objects)

# Egalitarian Stratal OT (Bermudez-Otero, 2008)

	<b>Phonological Evaluation of</b>
(Morpheme Level:	Roots and affixes)
<b>Stem Level:</b>	Stems and word-level affixes
<b>Stem Level:</b>	Words

## Egalitarian Stratal OT (Bermudez-Otero, 2008)

	<b>Phonological Evaluation of</b>
<b>Lexical Array:</b>	stupid, -ity, -s
<b>Stem Level:</b>	stupidity, -s
<b>Word Level:</b>	stupidities

# Ngalakan Word Stress

Bisyllabic Affixes seem to behave like independent PWords  
with respect to stress assignment

(Baker,2005)

## Ngalakan: Alternating Stress (Baker,2005)

- a. (pólo) 'old person'
- b. (káma)la 'sky'
- c. (káŋa)(mùru) 'long-nose' (native honeybee)
- d. (káɹaŋ)(kàna)(ŋìni) 'wallaby sp.'

# Ngalakan: Morphologically Disrupted Stress (Baker,2005)

- a. (tʰótoyʔ)-ki                    ‘aunt-your’
- b. (tʰótoyʔ)-(kí-kkaʔ)            ‘aunt-your-LOC’
- c. (tʰótoyʔ)-ki-p(púlu)            ‘aunt-your-PL’
- d. (tʰótoyʔ)-ki-p(púlu-k)kaʔ    ‘aunt-your-PL-LOC’

# Generalization

“Polysyllabic suffixes and clitics are inherently footed, but the footing of monosyllabic suffixes and clitics is contingent on their surrounding environment.”

(Baker,2005:5)

# Basic Analysis

- ▶ **Stem Level:** Foot structure is built on stems and bisyllabic word-level affixes, but not on monosyllabic affixes
- ▶ **Word Level:** Stem-level foot structure must be maintained  
New feet can only be built on hitherto unfooted syllables

# Prosodic Constraints

<b>AL-FT</b>	The left edge of every foot should be aligned to the left edge of a word
<b>AL-WD</b>	The left edge of every word should be aligned to the left edge of a foot
<b>FT-BIN</b>	Feet should be binary
<b>PS-<math>\sigma</math></b>	Every syllable should be dominated by a foot node
<b>PS-SEG</b>	Every segment should be dominated by a syllable node

# Stem Level: Roots

**Input:** kaŋamuru

	PS-SEG	FT-BIN	PS- $\sigma$	AL-FT
☞ (káŋa)(mùru)				**
(káŋa)mùru			*!*	
(ká)(ŋa)(mù)(ru)		*!		*****
kaŋamuru	*!*****			

**Input:** kamala

	PS-SEG	FT-BIN	PS- $\sigma$	AL-FT
☞ (káma)la			*	
ka(mála)			*	*!
(káma)(lá)		*!		**
kamala	***!***			

# Stem Level: Affixes

**Input:** -ppulu

	PS-SEG	FT-BIN	PS- $\sigma$	AL-FT
☞ (ppulu)				
<u>ppulu</u>			*!*	
ppulu	*!****			

**Input:** -ŋki

	PS-SEG	FT-BIN	PS- $\sigma$	AL-FT
(ŋki)		*!		
☞ <u>ŋki</u>			*	
ŋki	*!**			

# Prosodic Faithfulness Constraint

**FTH-FT**

Syllables which are dominated by a foot F in the input should be dominated by a foot corresponding to F in the output

# Word Level: Complex Forms

**Input:** (tótóyʔ)-ki-kkaʔ

	FTH-FT	PS-SEG	FT-BIN	PS- $\sigma$	AL-FT
☞ (tótóyʔ)-(kí-kkaʔ)					**
(tótóyʔ)- <u>ki-kkaʔ</u>				*!*	
(tótóyʔ)-(ki)-(kkaʔ)			*!		*****

**Input:** (tótóyʔ)-ki-p(púlu)

	FTH-FT	PS-SEG	FT-BIN	PS- $\sigma$	AL-FT
☞ (tótóyʔ)- <u>ki-p(púlu)</u>				*	**
(tótóyʔ)-(ki-p)(púlu)			*!		**
(tótóyʔ)-(ki-ppu) <u>lu</u>	*!			*	

# Yidj Penultimate Vowel Lengthening

Bisyllabic suffixes seem to behave as independent PWords

regarding a process which lengthens the penultimate syllable

of a word with uneven syllable number

# Penultimate Vowel Lengthening in Bare Roots

## Bisyllabic Roots

**mú**.ɖam ‘mother’ (abs.)

**gá**.liŋ ‘go’ (pres.)

## Trisyllabic Roots

gu.**dá**:ga ‘dog’

ma**dj**:n.daŋ ‘walk up’

# Penultimate Vowel Lengthening in Affixed Words

## Bisyllabic Words

gú.da.gá-gu 'dog' (purp.)

## 3- or 5-syllabic Words

ga.lí:-na 'go' (purp.)

ŋu.naŋ.ga.ra:-n.da 'whale' (dat.)

# Disruption by Bisyllabic Syllables

ma.dj:n.da.-ŋa.lin ‘walk up (pres.)’

gu.má:ri.-da.gá:.-ŋu ‘to have become red’

## Yidj Penultimate Vowel Lengthening

The penultimate vowel of a Prosodic Word with uneven syllable number is lengthened

Bisyllabic Suffixes start new Prosodic Words

(Nespor & Vogel, 1986:34-35,134)

# Basic Analysis

- ▶ **Stem Level:** Feet are built on stems and bisyllabic word-level affixes, but not on monosyllabic affixes
- ▶ **Word Level:** Stem-level foot structure must be maintained  
New feet can only be built on hitherto unfooted syllables

**Lengthening applies to stressed syllables  
if these precede an unfooted syllable**

## Yidj: Stem-Level Footing – Roots

**Input:** mudam, ‘mother’

	FT-BIN	PS- $\sigma$
 (mu.dam)		
<u>mu.dam</u>		*!*
(mu).dam	*!	*

**Input:** gudaga, ‘dog’

	FT-BIN	PS- $\sigma$
 (gu.da)ga		*
<u>gu.da.g</u> a		**!*
(gu.da)(ga)	*!	
(gu).da.ga	*!	**

# Yidj: Stem-Level Footing – Affixes

**Input:** -daga, ‘inchoative’

	FT-BIN	PS- $\sigma$
☞ (da.ga)		
<u>da</u> .ga		*!*
(da). <u>ga</u>	*!	*

**Input:** -gu, ‘purposive’

	FT-BIN	PS- $\sigma$
(gu)	*!	
☞ <u>gu</u>		*

## Yidj: More Prosodic Constraints

<b>No-FIN</b>	Words should not end in stressed syllables
<b>*CLASH</b>	Avoid adjacent stressed syllables
<b>IAMB</b>	Feet should be iambic

## Yidj: Word-Level Footing

**Input:** (mu.dam), 'mother'

	FTH-FT	FT-BIN	NO-FIN	*CLASH	IAMB
☞ (mu.dam)					*
(mu.dam)			*!		
<u>mu.dam</u>	*!				

**Input:** (mu.dam)-gu, 'mother-purposive'

	FTH-FT	FT-BIN	NO-FIN	*CLASH	IAMB
☞ (mu.dam)-gu					
(mu.dam)-gu					*!
(mu.dam)-(gu)		*!	*		
<u>mu.dam-gu</u>	*!				***

## Yidj: Word-Level Footing

**Input:** (gu.ma).ri-(da.ga)-nu, 'red-inchoative-past'

	FTH-FT	FT-2	NO-FIN	*CLASH	IAMB
☞ (gu.ma).ri-(da.ga)-nu					
(gu.ma).ri-(da.ga)-nu					*!
(gu.ma).(ri)-(da.ga)(nu)		*!*			
(gu.ma)(ri.da)(ga.nu)	*!				
gu.ma.ri.da.ga.nu	*!				

## Yidj: Distribution of Word-Level Lengthening

(**mu**.dam)

(**gu**.da)(**ga**-gu)

(ma.**dj:n**).da.-(**ŋa**.lin)

(ŋu.**naŋ**).(ga.**ra:-n**).da

(mu.**da:m**)-gu

(gu.**ma:**).ri-(da.**ga:**)-nu

→ Stressed vowels are lengthened  
if they precede an unfooted syllable

# Hungarian Vowel Harmony

Bisyllabic suffixes seem to behave like independent PWords

since they are opaque to vowel harmony

# Hungarian Vowel Harmony: Backness

mos-**a**t            'make wash'  
wash-CAUS

küld-**e**t            'make send'  
send-CAUS

há**z**-**a**n            'in a house'  
house-IN

ker**t**-**e**n            'in a garden'  
garden-IN

# Hungarian Vowel Harmony: Rounding

há-z-hoz      ‘to a house’  
house-TO

ker-t-hez      ‘to a garden’  
garden-TO

tű-z-höz      ‘to a fire’  
fire-TO

# Hungarian Vowel Harmony: Transparent Vowels (i,i:,e:)

papír 'paper'

fut-ni 'to run'  
run-INF

papír-hoz 'to paper'  
paper-TO

Jul-is-nak 'Julis (dat.)'  
Julia-DIM-DAT

# Hungarian Vowel Harmony: Non-Harmony

sofőr-**nek**                    ‘driver (dat.)’  
driver-DAT

pözső-**nak**                    ‘Peugeot (dat.)’  
Peugeot-DAT

Fer-kő-**nak**                    ‘Ferko (dat.)’  
Frank-DIM-DAT

# Non-harmonizing Suffixes

<b>Inflectional</b>	<b>Derivational</b>
-kor	-kó
??	-ol
	-us
	-íroz
	-ist
	-ismus
	-u
	-a
	-ológ
	-ál
	-ifikál
	-ia
	...

# Hungarian Vowel Harmony: Domains

Nespor & Vogel (1986) (and Booij, 1984):

- ▶ Phonological word ( $\omega$ ) = stem (+ suffixes)
- ▶  $\omega$  is the domain of vowel harmony

<b>Stem+Stem Compound</b>	[ könyv ] <sub><math>\omega</math></sub> - [ tár ] <sub><math>\omega</math></sub>
<b>Prefix + Stem</b>	[ be ] <sub><math>\omega</math></sub> - [ utazni ] <sub><math>\omega</math></sub>
<b>Stem + Stem + Suffix</b>	[ lát ] <sub><math>\omega</math></sub> - [ kép-ünk ] <sub><math>\omega</math></sub>
<b>Stem + Case Suffix</b>	[ ház-ban ] <sub><math>\omega</math></sub>
<b>Stem + Postposition</b>	[ ház ] <sub><math>\omega</math></sub> [ mellett ] <sub><math>\omega</math></sub>

# Harmony across Stems + Suffixes

mos-**at**            'make wash'  
wash-CAUS

küld-**et**            'make send'  
send-CAUS

há**z**-**ban**            'in a house'  
house-IN

ker**t**-**ben**            'in a garden'  
garden-IN

# No Harmony across Stems + Prefixes

- a. **oda**-**meni** 'to go there'  
there-go
- b. **be**-**utazni** 'to commute in'  
in-commute

# No Harmony across Compound Members

a. Buda-Pest      'Budapest'

b. könyv-tár      'library'  
book-collection

# Empirical Errata in the Nespor & Vogel Description

- ▶ Prefixes are irrelevant for Vowel Harmony
- ▶ Bisyllabic Inflectional Suffixes systematically fail to harmonize

# Prefixes

- ▶ **“Preverbs”:**  
particles forming idioms with and prosodically integrated into verbs, but syntactically independent
  - ▶ **Derivational Loan Prefixes:**  
with unclear morphophonological status (anti-, pre-, extra-, . . .)
  - ▶ **leg-:**  
The only inflectional prefix
- It is problematic to make any phonological generalization based on prefixes

## Trommer (2008)

- ▶ Derivational Affixes follow the generalizations by Nespors & Vogel (1986), but inflectional affixes don't
- ▶ **Monosyllabic** inflectional suffixes harmonize with stems  
**Bisyllabic** inflectional suffixes resist harmony with stems
- ▶ This becomes only evident by comparing monosyllabic and bisyllabic case suffixes (all other inflectional affixes are basically monosyllabic)

# Hungarian Case Suffixes

- ▶ Traditionally only monosyllabic case suffixes are analyzed as such  
bisyllabic case suffixes are called postpositions
- ▶ But “Case suffixes” and postpositions differ only for phonological purposes (e.g. in vowel harmony)
- ▶ but bot classes behave in the same way with regard morphosyntax

# Monosyllabic vs. Bisyllabic Case Suffixes

Monosyllabic ("Case Suffixes")		Bisyllabic "Postpositions"	
<i>-nak/-nek</i>	dative	<i>alatt, alól, alá</i>	'under'
<i>-ban/-ben</i>	'in'	<i>mögött, mögül, mögé</i>	'behind'
<i>-ból/-ből</i>	'into'	<i>előtt, elől, elé</i>	'in front of'
<i>-on/-en/-ön</i>	'on'	<i>felett, felől, felé</i>	'above'
<i>-ról/-ről</i>	'from'	<i>között, közül, közé</i>	'between'
<i>-ra/-re</i>	'onto'	<i>mellett, mellől, mellé</i>	'besides'
<i>-nál/-nél</i>	'at'	<i>helyett</i>	'instead of'
<i>-tól/-től</i>	'from'	<i>miatt</i>	'because of'
<i>-hoz/-hez/-höz</i>	'to'	<i>nélkül</i>	'without'
<i>-val/-vel</i>	'with'	<i>szerint</i>	'according to'
		<i>iránt</i>	'towards'

# All Case Suffixes Combine with Caseless NPs

Case Suffixes	Postpositions	Postpositional Adverbs
<i>János-Ø-hoz</i> János-Ø-to 'to John'	<i>János-Ø mellett</i> János-Ø next:to 'next to John'	<i>János-sal együtt</i> János-with together 'together with John'
★ <i>János-sal-hoz</i>	★ <i>János-sal mellett</i>	★ <i>János-Ø együtt</i>

# All Case Suffixes are Right-Adjacent to Head Noun

## Case Suffixes

*pontosan* János-hoz  
 exactly János-to  
 'exactly to John'

★ *János-pontosan-hoz*

## Postpositions

*pontosan* János mellett  
 exactly János next:to  
 'exactly next to John'

★ *János pontosan mellett*

## Postpositional Adverbs

*János-sal teljesen* együtt  
 János-with completely together  
 'completely together with John'

★ *teljesen János együtt*

# All Case Suffixes Trigger Demonstrative Concord

<b>Case Suffixes</b>	<i>a-hoz a fiú-hoz</i> that-to the boy-to 'to that boy'	★ <i>az a fiú-hoz</i>
<b>Postpositions</b>	<i>az alatt a fa alatt</i> that under the tree under 'under that tree'	★ <i>az a fa alatt</i>
<b>Postpositional Adverbs</b>	<i>az-zal a fiú-val együtt</i> that-with the boy-with together 'together with that boy'	★ <i>az-zal együtt a fiú-val együtt</i>

# Mono- vs. Bi-syllabic Case Suffixes in Vowel Harmony

		<i>a ház <b>alatt</b></i>	<i>a kert <b>alatt</b></i>
		the house under	the garden under
		'under a house'	'under a garden'
<i>a ház-<b>ben</b></i>	<i>a kert-<b>ben</b></i>		
the house-in	the garden-in		
'in the house'	'in the garden'		
		<i>a ház <b>mellett</b></i>	<i>a kert <b>mellett</b></i>
		the house next:to	the garden next:to
		'next to a house'	'next to a garden'

# Empirical Assumptions

- ▶ I will disregard rounding harmony and transparent vowels
- ▶ Prefixes are irrelevant for the understanding of VH
- ▶ For roots and derivational affixes, harmony is a strong tendency, not the rule
- ▶ Monosyllabic inflectional affixes invariably harmonize  
Bisyllabic inflectional affixes invariably fail to harmonize

# Basic Analysis

- ▶ **Stem Level:**  
Mono- and bi-syllabic affixes get differential (non-)footing just as in Ngalakan and Yidj
- ▶ **Stem Level:**  
1-syllabic (unfooted) suffixes are underspecified for [back]  
2-syllabic (footed) affixes are specified for [back]
- ▶ **Word Level:**  
1-syllabic affixes harmonize due to their underspecification  
2-syllabic affixes don't due to their full specification

# Analysis of Roots

## Prosody:

- ▶ Roots (and compounds) are left-aligned with alternating trochees at the stem level
- ▶ and with with a single trochaic foot at the word level

## Harmony

- ▶ Roots are underlyingly fully specified for vowel quality
- ▶ Due to high-ranked IDENT<sub>LEX</sub>, root vowels do not harmonize at stem or word level

# Root Prosody: Evaluation

## Stem Level:

**Input:** kert

	PS-SEG	Al-Wd	FT-BIN	PS- $\sigma$	AL-FT
 (kert)			*		
<u>kert</u>		*!		*

# Advantages of the Stratal Analysis

- ▶ derives the fact that 2-syllabic inflectional affixes show exceptionless morpheme-internal harmony
- ▶ derives the fact that 2-syllabic inflectional suffixes are unharmonic while 1-syllabic ones are harmonic
- ▶ captures the greater exceptionality of backness harmony in roots and internal suffixes

# Problems with the PWord Analysis

- ▶ cannot explain why bisyllabic suffixes don't show stress
- ▶ involves non-local types of alignment constraints

## PWord Analysis in Trommer (2008)

### **ALIGN (HdFOOT, ⇔, PWD, ⇔):**

Align the left edge of syntactic terminals  
corresponding to . . . two syllables  
to the left edge of a PWord

- The alignment constraint refers  
non-locally to entire morphemes

(cf. also Baker, 2005 on Ngalakan)

# Summary

- ▶ 2-syllabic affixes with word-like phonological behaviour can be captured without the PWord
- ▶ Strata, feet and syllables are enough
- ▶ Stratal analyses capture additional generalizations and avoid problems raised by PWord accounts
