## Allomorphy between tone and segments in Yucunany <br> Mixtepec <br> An optimality-theoretic account

## Eva Zimmermann (Leipzig University)

October 10, 2014

P\&P 10, Konstanz
va Zimmermann (Leipzig U)
Allomorphy in Yucunany Mixtepec P\&P 10, Konstanz

Non-concatenative PCSA

- non-concatenative 'PCSA': in (3), different operations (gemination, vowel lengthening) apply
■ both operations can be analysed in autosegmental phonology as addition of a $\mu$
(3) Non-concatenative 'PCSA' in Asante Twi (Dolphyne 1996, Paster 2010)

|  | Base |  | Past (+ОвJ) | Possible analysis: |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| a. | to dane | 'to buy' 'to turn' | to: dane: | $\left.\mathrm{t}\right\|_{0} ^{\mu+\mu} \rightarrow$ |  |
| b. | nom spame: | 'to drink' <br> 's/he sewed (it)' | nom: <br> opam: |  | $\begin{array}{cc} \mu & \mu \\ \mid & \vdots \\ 0 & \dot{m} \end{array}$ |

## (1) PCSA

(cf., for example, Paster 2006)
The surface representation/effect of one morpheme $M$ is different depending on the phonological context and this difference cannot be attributed to phonological changes independently expected in this context.
(2) Segmental PCSA in Moroccan Arabic

|  | Base | 3.Sc.MASC |  |
| :--- | :--- | :--- | :--- |
| a. | Jafu | Safuh | 'error' |
| b. | ktab | ktabu | 'book' |

(Mascaro 2007)

## Possible analysis:

 3.Sc.M $\leftrightarrow / \mathrm{h} / / \mathrm{V}$ 3.Sg.M $\leftrightarrow / \mathrm{u} / / \mathrm{C}$Introduction

- propose an analysis for a phonologically predictable allomorphy in Yucunany Mixtepec Mixtec (=YM)
- a morphological low tone with different surface effects, or
- the realization of additional segments
- an argument for contrastive prosodic specification in the underlying form:
different underlying syllable structure $=$ different surface effects
$\rightarrow$ a prediction of OT and Richness of the Base

Mixtec languages

■ indigenous languages, spoken in southern Mexico (Otomanguean)

- most communities have less than 50.000 speakers (McKendry 2013)
(4)

Eva Zimmermann (Leipzig U) Allomorphy in Yucunany Mixtepec P\&P 10, Konstanz $5 / 32$
Allomorphy in Yucunany Mixtepec

Background on Yucunany Mixtepec Mixtec (YM)
(Pike\&Ibach 1978, Paster\&Beam 2004a,b, Paster 2007,2012)

- no codas, restricted set of initial onset clusters
- three tones: $\mathrm{H}(=\mathrm{V}), \mathrm{M}(=\mathrm{V}), \mathrm{L}(=\mathrm{V})$, and contour tones
- vowel length is not contrastive - default assumption: TBU= $\sigma$ ('VV(VV)' notated to have enough space for contour tones!)
- underlined V's=nasalized V's

Eva Zimmermann (Leipzig U) Allomorphy in Yucunany Mixtepec $\qquad$ P\&P 10, Konstanz 6/32
Allomorphy in Yucunany Mixtepec
1.Sg formation in YM

- a low tone is added and creates a contour on the final $\sigma$ (5-a)
- a low tone overwrites $M$ on final $\sigma$ (5-b)

■ a segmental allomorph /-yù/ surfaces (5-c)
(5) Tonal allomorphy in Yucunany Mixtepec (Paster\&Beam 2004:3-4)

| a. | nàmá | 'soap' | nàmáà | 'my soap' | L H | $\rightarrow$ L HL |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | tìtzi | 'stomach' | tìtziì | 'my stomach' | L M | $\rightarrow \mathrm{LML}$ |
| b. | la'la | 'mucus' | la'là | 'my mucus' | M M | $\rightarrow \mathrm{M}$ |
|  | xá'nu | 'cigarette' | xá'nù | 'my cigarette' | HM | $\rightarrow \mathrm{HL}$ |
| C. | sòkò | 'shoulder' | sòkòyù | 'my shoulder' | L L | $\rightarrow \mathrm{LL}$ yù |
|  | tutù | 'paper' | tutùyù | 'my paper' | M L | $\rightarrow \mathrm{ML}$ yù |

1.Sg formation in YM: context generalizations
A. a low tone is added and creates a contour for H -final stems
(6) nàmá 'soap' nàmáà 'my soap' L H $\rightarrow$ L HL
xinii hat xíniii my hat H LH $\rightarrow$ HLHL
B. a low tone overwrites $\mathbf{M}$ on final $\sigma$

| (7) $\quad$ la'la | 'mucus' | la'là | 'my mucus' | $\mathbf{M M}$ | $\rightarrow \mathbf{M L}$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | xánu | 'cigarette' | xá'nù | 'my cigarette' | $\mathbf{H M}$ | $\rightarrow \mathbf{H} \mathbf{L}$ |

$\rightarrow$ if this would not create an LH L
(8) yùúti 'sand' yùútiì 'my sand' LHM $\rightarrow$ LH ML yòóso 'metate' yòósoò 'my metate' LHM $\rightarrow$ LH ML
$\rightarrow$ or an L L
(9) titzi 'stomach' titziì 'my stomach' $L \boldsymbol{M} \rightarrow \mathrm{LML}$ kwà'a 'man's sister' kwà’aà 'my man's sister' LM $\rightarrow$ LML
C. a segmental allomorph /-yù/ surfaces if the stem ends in a L-toned $\sigma$

$$
\begin{array}{llllll}
\text { (10) } \quad \begin{array}{llll}
\text { sòkò } & \text { 'shoulder' } & \text { sòkòyù } & \text { 'my shoulder' }
\end{array} \quad \mathrm{L} \mathbf{L} & \rightarrow \mathrm{~L} \text { L yù } \\
& \text { tutù } & \text { 'paper' } & \text { tututyù } & \text { 'my paper' } & M \mathbf{L}
\end{array} \rightarrow M \mathbf{L} \text { yù }
$$

Eva Zimmermann (Leipzig U) Allomorphy in Yucunany Mixtepec P\&P 10, Konstanz $\quad 9 / 32$

[^0]Theoretical question

Is a monorepresentational analysis possible?

- Why does an additional low tone sometimes creates a new contour tone and sometimes overwrites an underlying base tone?
- How can the addition of a tone and the realization of a segmental string follow from a single underlying representation?
- 1.Sc is 'marked by a floating $L$ tone that associates to the end of the root' (p.71)
- a different allomorph /yù/ for bases ending in L
$\rightarrow$ homophony avoidance

Eva Zimmermann (Leipzig U)
Allomorphy in Yucunany Mixtepec
P\&P 10, Konstanz 10 / 32
(1) Non-realization of /yu/

- the /yu/ underlyingly lacks a $\sigma$ node and since $\operatorname{Dep}-\sigma$ (11-a) is higher ranked than Max-S (11-b), the morpheme is preferably not realized
$(\rightarrow$ morphemes that are realized in all contexts have an underlying $\sigma$ )
- the $L$ must be realized due to undominated Max-L (11-c)

A segmental /yu/ + L; the former only realized as last resort

$$
1 . \mathrm{SG} \leftrightarrow{ }^{\mathrm{L}} \mathrm{yu} / \#
$$

Eva Zimmermann (Leipzig U)

$\begin{array}{ccl}\text { (11) } & \text { Dep } & \text { Assign a violation mark for every output } \sigma \text { without } \\ & \sigma & \text { an input correspondent. }\end{array}$
b. Max Assign a violation mark for every input segment S without an output correspondent.
c. Max Assign a violation mark for every input L-tone withL out an output correspondent.

[^1]Allomorphy in Yucunany Mixtepec
P\&P 10, Konstanz

A monorepresentational analysis for YM
(2) Contour creation vs. overwriting

- contour tones are penalized by ${ }^{*} \operatorname{ConTOUR}_{\sigma}\left(={ }^{*} \mathrm{CNT}_{\sigma}\right)(13-\mathrm{a})$
- a contour is created with base-final H's since MAx-H (13-b) and Max-L dominate * $\mathrm{CNT}_{\sigma}$
■ overwriting is predicted since ${ }^{*} \mathrm{CNT}_{\sigma}$ dominates MAx-M (13-c)
(13) a. $\quad{ }^{*} \mathrm{CNT}_{\sigma}$ Assign a violation mark for every $\sigma$ that is associ-
${ }^{*} \mathrm{CNT}_{\sigma}$ ated to more than one tone. (Yip 2002:80)
b. Max Assign a violation mark for every input H-tone H without an output correspondent.
c. Max Assign a violation mark for every input $M$-tone M without an output correspondent.
(14) Floating L creates a contour with base-final $H>$ (6)

|  | $\begin{array}{c:c:c} \text { Max } & \text { Max } & \text { Dep } \\ L & H & \sigma \end{array}$ | ${ }^{*} \mathrm{CNT}_{\sigma}$ | $\begin{gathered} \text { Max } \\ M \end{gathered}$ | $\begin{gathered} \text { MAX } \\ \mathrm{S} \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1是 a . | 1 1 <br> 1 1 <br> 1 1 <br> 1 1 <br> 1 1 | * |  | ** |
| b. | $\begin{array}{llll} 1 & & 1 \\ 1 & *! & 1 \\ 1 & * & 1 \\ 1 & & 1 \\ 1 & & 1 \end{array}$ |  |  | ** |

Eva Zimmermann (Leipzig U)
Allomorphy in Yucunany Mixtepec
P\&P 10, Konstanz
17/32

A monorepresentational analysis for YM
(3) No adjacent L-initial syllables
no overwriting of $M$ if two adjacent $\sigma$ 's both associated with an $L$ at their left edge would result

- a positional, non-local OCP (16) banning two adjacent $\sigma$ 's starting both with an L
(16) $\quad * \mathrm{~L}_{\sigma}^{\mathrm{L}} \sigma$ Assign a violation mark for every pair of adjacent $\sigma$ 's that are associated with an initial $L$.

## Floating L overwrites a base-final $M>$ (7)

|  | Max <br> L | Max <br> H | Dep <br> $\sigma$ | ${ }^{*} \mathrm{CNT}_{\sigma}$ | Max <br> M | $\begin{gathered} \text { MAX } \\ S \end{gathered}$ |

Eva Zimmermann (Leipzig U $\qquad$

- association of $L$ to bases ending in an $L$ is excluded by *[TT]: contour tones (adjacent tones associated to the same TBU) must be different

■ realization of /yu/ as last resort to satisfy MAx-L becomes optimal
Assign a violation mark for every pair of adjacent identical tones that are associated to one TBU.

## YM: complete ranking

(21)

- a monorepresentational analysis:
- a floating tone and
- a segmental string that is only realized as last resort
- the learner is faced with an instance of incomplete neutralization: in 4 of 5 possible (phonological) contexts, she is only provided with a subset of evidence for the complete representation (only the tone, not the segmental content)

Richness of the base and underlying contrast

- (22-a) and (22-b) are both possible input representations in OT
(22)
a.
$\stackrel{\Delta}{\mathrm{yu}}$
b.
yu
$>$ realized in all contexts
$>$ realized as a last resort
- the analysis based on Dep- $\sigma$ implies that this difference between underlying forms has crucial surface effect
- independent arguments for contrastive syllabification in, for example, Elfner (2006), losad (2013), or Vaux (2013)
$\rightarrow$ an economy argument: a lexical contrast is reduced to a difference in underlying prosodic structure

Implications and further prediction

Eva Zimmermann (Leipzig U)
Allomorphy in Yucunany Mixtepec
P\&P 10, Konstanz 26/32
Implications and further prediction

More allomorphy involving defective segmental morphemes: Aymara

- morphemes triggering lengthening of a preceding vowel in La Paz Aymara (Andes, spoken in Bolivia and Peru)
(23) Vowel lengthening in the future (Briggs 1976, Hardman 2001)

|  | BASE | FUtURE |  |
| :--- | :--- | :--- | :--- | :--- |
| a. | sara <br>  <br> 'go' | sara: <br> '(I) will go' | B265+266 |
| b. | apa | apa:tam |  |
| 'bring, have' | 'he will bring' <br> al | H211 |  |
| c. | alja <br> 'sell' | alja:ma <br> 'I will sell' | H211 |

- whenever double-lengthening is expected, /-ja:/ surfaces
- no superlong vowels: alternative repair to realize both 'lengthenings'
(24) Allomorphy between : and ja (Beesley 2000)
a. warmi-:-:
women-VB-1>3.FUt
'I will be a women'
warmija: *warmi::
b. qul ${ }^{\mathrm{j}}$ i-ni-:-:-ta
money-possessor-Vв-1>3.Fut-FS
'You will have money'
qulquinija:ta *qul ${ }^{j}$ qini:ita

[^3]Allomorphy in Yucunany Mixtepec
P\&P 10, Konstanz

Aymara: monorepresentational analysis

- /-ja/ underlyingly lacks a $\sigma$ and is not realized if lengthening possible
- realization of/ja/ implies a violation of DEP- $\sigma$ and is dispreferred
- Max- $\mu$ demands that its $\mu$ must be realized: lengthening of preceding $V$
$\rightarrow$ realization of /-ja/ as last resort to realize the $\mu$
(25) Autosegmental analysis of Aymara

- ${ }^{\mu}$
(Leipzig U)
Allomorphy in Yucunany Mixtepe
P\&P 10, Konstanz 30/32

A monorepresentational account of allomorphy

- for an account of allomorphy in YM where realization of only an additional tone alternates with realization of segments
$\rightarrow$ crucial assumption: prosodically defective segments are only realized as a last resort
- extension of this account to Aymara where a non-concatenative allomorph alternates with a segmental allomorph as well
- prosodically defective morphemes are independently predicted in OT: an economy argument if they can account for apparently lexical contrasts/allomorphy pattern
